

PITHIA e-Science Centre

Prof Tamas Kiss

University of Westminster

3rd Innovation Day – 12/06/2024

Warsaw, Poland

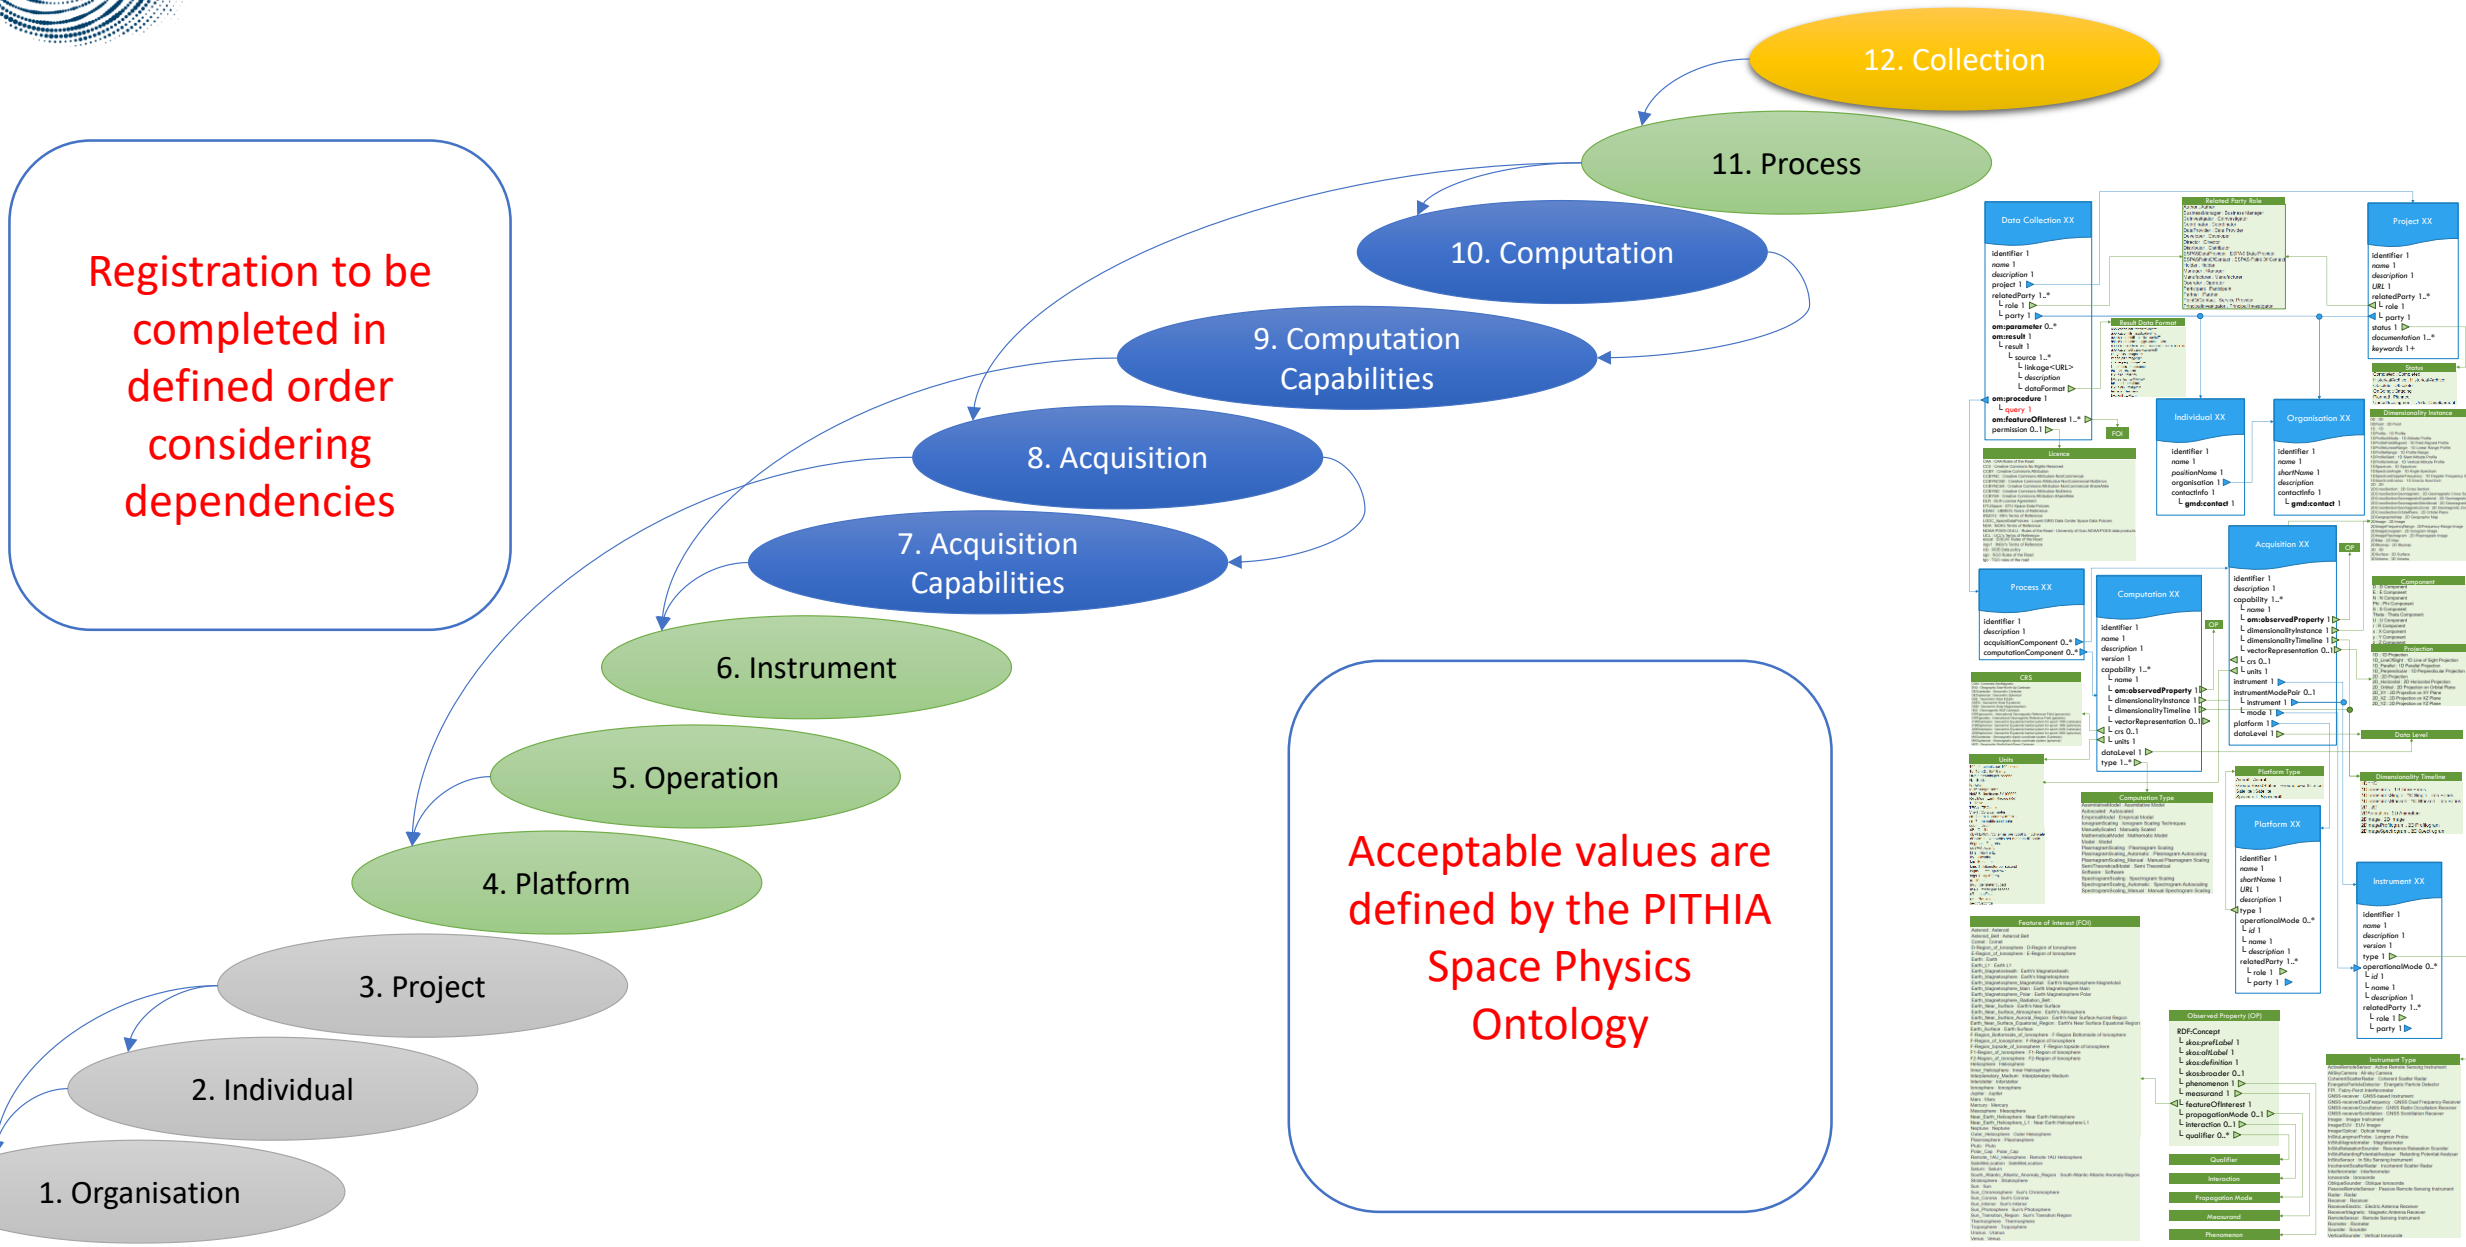

What is the PITHIA e-Science Centre?

- A central web portal to provide a single point of entry to heterogeneous and distributed resources (Data Collections)
 - Datasets
 - Models
 - Catalogues
 - Workflows
- Standardised metadata and ontology-based search
- Seamless interaction with all registered resources
- Usage is free and available for everyone – <https://esc.pithia.eu>

PITHIA Ontology and Metadata Structure

Yes, it looks complicated, BUT

➤ **Complication is for the provider**

- Needs to describe its assets in XML format – only once
- Templates, manuals, help and tools are provided for support

➤ **Gain is for the scientist (user)**

- Gets very detailed and precise information about the assets
- Can utilise very sophisticated ontology based search

[The 1D EDD version of the TaD Model](#)

The TSM-assisted Digisonde (TaD) Profiler (TaD model) is a topside profiler for the electron density profile based on empirical equations derived from topside sounding data of the Alouette/ISIS database and ingests the Digisonde observations at the height of the maximum electron density and the TEC parameters to adjust the profiler with the actual conditions of the ionosphere. The model has three components: (a) the Topside Sounders Model (TSM) subroutine (Kutiev and Marinov 2007; Kutiev et al. 2006) that provides the...

[DTM2020-operational: semi-empirical thermosphere model](#)

The Drag Temperature Model is the in-house developed semi-empirical model of the thermosphere. Its main application is in orbit determination and prediction. It provides point-wise predictions of total mass density, temperature, and partial densities of the main constituents (O₂, N₂, O, He). The solar driver is F10.7 and the geomagnetic driver of the model is Kp. The backbone of the data used to fit the model coefficients are the high-resolution and precision accelerometer-inferred densities of the GOCE, CHAMP and GRACE...

[eSWua IONOWORLD tool: Long-term forecasting global TEC maps](#)

This collection contains the Long Term Forecasting maps of the ionospheric Total Electron Content (TEC) [1] on a global scale (latitudinal and longitudinal ranges of 87.5°S–87.5°N and 180°W–180°E, respectively). The vTEC is estimated 24 hours in advance every 2 hours on a grid of 2.5° X 5° (lat x long). The proposed model is implemented through an algorithm consisting of two separate parts, working in cascade. The first part, termed "Single point TEC forecasting", focuses on the 24-h ahead prediction of vTEC on selected...

BSPM: 3D-Kinetic plasmasphere model

Royal Belgian Institute for Space Aeronomy

Description

The BSPM (Belgian SWIFF Plasmasphere Model) is a 3D-Kinetic semiempirical model of the plasmasphere developed by the Solar Wind Division of the Royal Belgian Institute for Space Aeronomy (Pierrard et al., 2021 for the last version). Based on physical mechanisms for the plasmopause formation and trajectories of particles trapped in the Earth's magnetic field, it provides the number density and the temperature of the electrons and protons inside and outside the plasmasphere, as well as the position of the plasmopause, as a function of the geomagnetic activity driven by the Kp index. During geomagnetic storms, the plasmasphere is eroded and structures like plasma plumes and channels can appear (Pierrard and Stegen, 2008). During quiet times, the ionosphere refills the plasmasphere. The model is coupled to the International Reference Ionosphere (IRI) model (<http://irimodel.org/>) used to determine the number density and temperatures of the particles between 60 and 700 km of altitude (Pierrard and Voiculescu, 2011). The values at 700 km are used as boundary conditions to provide the density and temperatures up to 10 Earth radii inside and outside the plasmasphere. The density in the plasmatrough region has recently been improved using observations of Van Allen Probes (Botek et al., 2021). The model is running in a near-real-time basis by the name of 'SPM' at the Space Situational Awareness site (<https://swe.ssa.esa.int/bira-swiff-federated/>) of ESA (European Space Agency) using a previous IDL-Fortran version that evaluates the electron density and temperature without the ionosphere coupling, and providing animations of the equatorial and meridian plasmasphere dynamics for all the archived dates since 2017. A PYTHON-Fortran version BSPM by the name of 'BPIM' is available in the frame of the ESA Virtual Space Weather Modeling Center (<https://swe.ssa.esa.int/kul-cmpa-federated/>) for on-demand executions. In the present implementation at the PITHIA eSC, a more updated version of the PYTHON-Fortran implementation is available providing the electron density of the plasmasphere, the ionosphere coupling as well as the electron density beyond the plasmopause, i.e., the plasmatrough for the requested day. Output of the model consists of text files and figures for every hour of a simulated day. The same BSPM version is also available at the Community Coordinated Modeling Center (<https://ccmc.gsfc.nasa.gov/models/BSPM~2021/>). References: Pierrard, V. and Stegen, K., 2008. eSC Highlights – Resource management

- Registered users can create, delete or modify resources under their institution
 - A resource can be a Data Collection, a Workflow or a Catalogue
 - Registering a Data Collection requires up to 12 steps
- Resource registrations are in XML format
- Two options for managing/creating XML files
 - Edit XML files off-line and upload them
 - Use registration wizard to generate XML automatically

New Data Collection

Data Collection Full Name *

Organisation Associated With the Data Collection *

The chosen organisation's short name will be used as this registration's namespace.
Note: This is not necessarily the same as the institution that you are logged in with.

Identifier

Local ID *

The local ID is automatically generated from the full name you give this registration. It must be unique, so if the local ID generated has already been taken a timestamp will be added to help ensure uniqueness. The local ID also cannot be changed once this form is submitted.

DataCollection_

Namespace *

This is automatically generated with the short name of the selected organisation.

Metadata Version *

The version number of the object being identified.

Complete fields by typing in information directly

Select information from drop down box

Some information is generated automatically so that user does not have to worry
